

InClassWork4

Scenario:

A company has sales data from different branches stored in various formats such as CSV files and text files and database files using sqlite3. The data needs to be combined into a single SQLite database. Additionally, the data contains noise and inconsistencies that must be cleaned before performing any analysis. Your task is to import the data from different sources, clean the data, and then store the clean data in a database. Afterward, you will perform additional analyses on the clean data.

Task1: Centralize the Data

Task 2: Identify and Remove Outliers

Task 3: Calculate Monthly Sales Trends
